

Класове и медоти – задачи

1 зад. Импровизационна демонстрация с код, според неясните неща и идеи на учениците.

2 зад: Създайте метод, който изписва дали дадено число е positive / negative, 0

3 зад; 4 метода **add**", **"multiply"**, **"subtract"**, **"divide"** + 2 числа

4 зад: поръчка order - **"coffee 0.80"**, **"water 1.70"**, **"coke"**, **"snacks"** , quantity + Print the result, rounded to the second decimal place.

5 зад: The method should return the **base** raised to the given **power**.

6 зад: **biggest of the two values**.

7 зад: The first will be the first **number**, the second one will be the **operator** and the last one will be the **second number**. The possible operators are: **/**, *****, **+** and **-**.

8 зад: Create a method that **prints out the smallest of three integer numbers**.

9 зад; VowelCount - Create a method that receives a **single string** and **prints out the number of vowels** contained in it.

10 зад: Create a method that receives **two characters** and prints all the **characters between them according to ASCII** (on a single line).

NOTE: If the second letter's ASCII value is less than that of the first one, then the two initial letters should be swapped.

11 зад: PasswordValidator: The password validation **rules** are:

- It should contain **6 – 10 characters (inclusive)**
- It should contain **only letters and digits**
- It should contain **at least 2 digits**

If it is **not valid**, for any unfulfilled rule **print the corresponding message**:

- **"Password must be between 6 and 10 characters"**
- **"Password must consist only of letters and digits"**
- **"Password must have at least 2 digits"**

12 зад: You will receive a single string. Create a method that **prints the character found at its middle**. If the **length** of the string is **even**, there are **two middle characters**.

13 зад: Create a method that receives a single integer **n** and prints an **NxN** matrix using this number as a filler.

14 зад: Create a program that reads positive integers **until you receive the "END"** command. For each number, **print whether the number is a palindrome or not**. A palindrome is a number that reads the same backward as forward, such as 323 or 1001.

15 зад:

Защо използваме вградените Min.Value и Max.Value? – Обикновено при сортиране

Намиране на най-малка стойност – като правило, сравняваме я с максимума. Ако е по-малка от максимума, тя става максимум.

```
static int FindMin()
{
    string input = Console.ReadLine();
    int min = int.MaxValue;

    while (input != "stop")
    {
        int n = int.Parse(input);

        if (n < min)
        {
            min = n;
        }
        input = Console.ReadLine();
    }
    Console.WriteLine("min = " + min);
    return min;
}
```

Аналогично използваме противоположните `int max = int.MinValue;`

Method overloads
